The following is an examiner's statement of reasons for indicating allowance of claims 12, 19 and 21: The prior art teaches a method for regulating current through an electromagnetic actuator, the electromagnetic actuator, a first switch and a current-measuring circuit forming a series circuit, a free-wheeling diode being parallel connected to the electromagnetic actuator, closing and opening the first switch by an automatic control; altering a time duration of one on and off switching cycle of the PWM signal; but does not disclose a signal, wherein for the dither function, a dither value is added to or subtracted from each pulse of the PWM signal, wherein a time duration during which the dither value is added to the pulses of the PWM signal is equal to a time duration during which the dither value is subtracted from the pulses, and wherein the time duration during which the dither value is added to the pulses and the time duration during which the dither value is subtracted from the pulses yield a total time duration which is a multiple of the time duration of one on and off switching cycle of the PWM signal. This feature in combination with the rest of the claim limitations is not anticipated or rendered obvious by the prior art of record.

The following is an examiner's statement of reasons for indicating allowance of claim 16: The prior art does not disclose altering a time duration of one on and off switching cycle of the PWM signal; and superimposing a dither function in a form of a low-frequency oscillation on the PWM signal, wherein the current flowing through the electromagnetic actuator and measured by the current-measuring circuit is freed from the dither function by a corrector. This feature in combination with the rest of the claim limitations is not anticipated or rendered obvious by the prior art of record.
